

TOGOXchange is a tool to read in TOYOTA's proprietary TOGO model tree structure format and replicate the hierarchy within ANSA.

The tool reads .nas file with TOGO comments which describes the tree-structure and converts it to ANSA's Part/Group structure. It also lets the user to manage the tree-structure, create new TOGO entities with specific naming convention. The tool allows you to output the model with TOGO comments back into a NASTRAN file.

This lets the user to maintain and carry over their tree-structure between TOGO system and ANSA while making best use of both the tools.
